How to create an HTML form and insert data into the database using Django

In an earlier tutorial, we have learned to create a Django form. In this tutorial, we are going to learn about creating Django forms and inserting data into the database.

The form is a graphical entity on the website where user information can be saved in the database through a save operation.

As a part of this tutorial, we are going to create a Django form to save user data. We will save this data into Django's database.

Create an HTML form and insert data into the database

Why do we use forms? We can normally give it to the models and add it to the views.py?

12:59 pm

There are a lot of things you can do with the forms. You can make the forms independent of models. It means you can create forms without a model. You can also add additional fields in the forms which does not require models. This is a good programming practice to adopt in the project development.

number
of
services
provided
by
different
salons
will be
different.
So how
we can
store all
services
in SQLite
database
for a
particular
salon.

Akash,
you need
to create
two
database
tables in
the case
of a
relational
database
system.

says,
Salon)
that store
detail
about
each
Salon.
Create
another
table
(with
name,
says,
Services)
that store
detail
about
each
service.
There
will be
one
foreign
key in
the
Services
table
derived
from the
primary
key of
the
Salon
table.

Halo,
thanks
for this
tutorial.
Now my
question
is how
do I
decorate
the form
fields so
that they
are
spaced
nicely,
because
as for
now
there is
no
spacing
between
the
fields.

accomplish this.

Here are two ways.

1. Simple solution is to use `form.as_table` over `form.as_p` in the Django template. It puts each field in the new cell with some spacing. You can also add some CSS.

2. If you want more control over each field, you can render each field manually using `render`.

```
{% render_field  
form.field_name  
class="form-  
control" %}
```

number
are very
close to
each
other.
Also, I
want to
add a box
for a
message
on how
can I set
it. Also,
can you
tell me
how
csrf_token
works

1."all the
fields
username
and mobile
number are
very close
to each
other."
– add
some
padding or
margin in

to add a
box for a
message”

– Use
TextField()
in Django.

3. “tell me
how
csrf_token
works”

– Basically,
the CSRF
token is a
value field
in Django
model
form, just
to ensure,
the POST
request or
form is
submitted
by the valid
user from
the trusted
domain.

There is a
separate
token
created for
each
session
user so
that only
